WE KNOW FACTORY MATCHED TO WORK IN PERFECT HARMONY. ALL KEY COMPONENTS FROM ONE SOURCE. WHAT WORKS BEST

The construction of reliable equipment for power factor correction requires not only your excellent experience, but also top-class components. No compromise in quality and safety should be permitted when it comes to the key parts of your PFC equipment. Because we do care, we are offering you the full set of essential components for your capacitor bank:

- The heart: Capacitors. Without them, PFC is impossible. They are the most sensitive and most important component.
- The protection: Most PFC nowadays cannot do without detuning reactors for harmonic protection anymore.
- The brain: The controller shall know what to do, and when.
- The muscle: Switching is one of the key functions in your PFC, and switching capacitors means maximum stress.

FIRST CLASS POWER MKPc™ COMPACT RANGE CAPACITORS FOR YOUR PFC

Apart from your excellent experience, the construction of reliable and competitive equipment for power factor correction requires top-class components at reasonable cost. No compromise in quality and safety should be permitted when it comes to the key part of your PFC equipment.

Germany's largest manufacturer of power capacitors manufactures all components with highest care and expertise and is your best choice for power capacitors and detuning reactors.

Being filled with the same neutral, inert gas as the capacitors of our renowned MKPg™ range, the phase shifters of our low-cost MKPc™-series are environmentally friendly, very compact, and easy to handle. Our capacitors may be mounted in any desired position. Should leakage occur, the leaking gas would escape into the atmosphere causing no undesirable effects to the adjacent equipment, e.g. damage, pollution, or staining. When disposing of the capacitors, no liquids or toxic gasses need to be considered.

Three-phase MKPc™ capacitors contain three separate capacitor elements connected in delta. By using the market's best low-loss, self-healing polypropylene films and sophisticated manufacturing

techniques such as high-vacuum drying and special coating patterns, MKPc™ provide long service life with constant capacitance and high switching stability. As a matter of course, all our power capacitors are provided with BAM™(overpressure break-action mechanism) as standard, for safe mode of failure.

Our original **CAPAGRIp™** terminals with their options K and L guarantee optimum sealing of the capacitors, and offer convenient connection of cables up to 25mm². A special spring system guarantees reliable and durable operation of the clamp. They are rated IP20, i.e. protected against accidental finger contact with live parts. **CAPAGRIp™ K** includes bleeding resistors for a discharge below 50V within less than 60 seconds; **CAPAGRIp™ L** permits the direct connection of discharge reactors and discharge resistor modules, as well as convenient parallel connection of additional capacitors within the permitted current limits.

SHIELD YOUR CAPACITORS FK-Dr™ THREE PHASE DETUNING REACTORS FROM RESONANCES

Contemporary practice of power factor correction has become unthinkable without the use of series reactors for blocking overloads and resonances with mains inductances. As a side effect, the overall level of harmonic distortion is also reduced to a considerable extent.

We manufacture our three phase filter reactors of specially selected transformer sheets and aluminium band or copper windings. Unlike many low-end products, our aluminium reactors are connected through copper terminals for long-term reliable connection.

The FK-Dr™ reactors are dried and impregnated in a vacuum with environmentally-friendly, low-styrene resin which ensures they can

withstand high voltages, have low noise levels, and offer a long operating life. High-class iron cores with multiple air gaps as well as a staid designing approach guarantee stable current linearity and low heat dissipation losses, at the same time allowing for compact dimensions and competitive cost. Compared with low-end reactors, our FK-Dr may save up to 100 Watts of heat dissipation losses per piece, a very important factor for the long-term operational cost (and amortisation) of your equipment.

The operating temperature of the reactor can be monitored externally by an integrated thermal switch (125°C).

Along with the common standard-rated reactors (for the usual range of capacitors) we offer a range of special reactors which, combined with properly-rated capacitors, produce exactly the required kvar output at mains voltage, allowing for reduced size and cost of your installation.

The kvar output of a capacitor depends on the voltage it is charged with. At higher voltage, equal capacitance delivers more kvar. A "non-adjusted reactor" (D) is matched to a power capacitor with standard rating at system voltage. This allows for use of capacitors "off the shelf", however with the increased output of kvar due to voltage rise inside the LC circuit, more power output is installed than actually required by the customer.

A reactor with **adjusted rating** (Dla) is considering this internal voltage rise inside the series circuit of capacitor/reactor, and is matched to a specially dimensioned capacitor with reduced capacitance. **Advantage:** The exact power is installed as required by the customer, and switching devices are stressed less. Both capacitor and reactor are smaller than the non-adjusted solution. Note that exact sizing of the capacitor is necessary.

For more detailed information, please order our comprehensive catalogue "Capacitors and Reactors for Power Factor Correction".

GOOD CAPACITORS PFR-X POWER FACTOR CONTROLLER ALONE WON'T DO

The PFR-X power factor controller calculates the active and reactive power in the mains from the measured current and voltage. The intelligent control algorithm optimizes the switching sequences and guarantees for short regulation times with minimum number of switchings. At the same time, switching operations are equally shared among the available capacitor branches where possible. The integrated connection control immediately detects in which phases voltage and current are measured, and adapts the entire system automatically. The very low current threshold of 10mA allows for very reliable and exact PF control. 1A as well as 5A current transformers can be used without additional manual adjustments. The power supply covers a voltage range of 90...550V.

The rated mains voltage is the only value to be entered before commencing operation of the PFR-X. Without this entry, the controller blocks operation to protect the capacitors. All other relevant parameters have been preset by the manufacturer for immediate start of operation in nearly any common configuration. Individual adjustment and optimization of the control parameters is possible at any time, even during operation of the equipment. The controller will operate correctly even if the value of the current transformer ratio has not been entered. It monitors the temperature inside the capacitor cabinet by means of an integrated sensor.

For more detailed information, please order our comprehensive catalogue "Capacitors and Reactors for Power Factor Correction".

MAKE SURE SPECIAL CAPACITOR CONTACTORS IT WORKS

The contactors of the 17237.004 series have been optimized for switching low-inductive and low loss capacitors in capacitor banks (IEC70 and 831, VDE 0560) without and with detuning reactors. They are fitted with pre-load contacts and damping resistors, in order to drastically reduce the inrush current, thus protecting the capacitors from destructive current surges, and the main contacts from premature deterioration or welding.

Unlike most capacitor contactors which are using a mechanical principle for switching the pre-load contacts, the 17237.004 series switches them by separate magnetic controls. As soon as the main switch has been closed, the pre-load contacts are released again and its resistor wires taken out of circuit after no more than 5...10ms of operation. This avoids additional heat losses in the resistor wires during the operation of the connected capacitor branch, and contrib-

butes to the high reliability and long operational life of our contactors.

Since the disconnection of inductive loads is usually accompanied by switch arcs, the pre-load contacts of mechanical capacitor contactors are often facing trouble when used with reactor-capacitor combinations (detuned capacitors) as they are lagging behind the main contact during the switch-off process. The contactors of our 17237.004 series are not affected by this problem as their pre-load contacts are already out of circuit. Hence they can be used for both detuned and non-detuned capacitor installations. **ELECTRONICON strongly recommends the usage of contactors with pre-load contacts even for detuned capacitors** in order to prevent ferro-resonances of the reactor during the start-up period.

CAPACITORS AND REACTORS – GENERAL TECHNICAL DATA

MKPC™

design	pressed aluminium can with stud M12 × 16, aluminium lid
internal connection	delta
tolerance of capacitance	- 5 ... + 10%
terminals	three phase terminal, M4 screws (Torx T20)
safety device	BAM™ (overpressure break action mechanism)
dielectric material	low-loss polypropylene, dry
impregnant (filling material)	N ₂
mounting position	any position
permitted overvoltages and test voltages	see data charts for details
maximum permissible current	at least 1.3 I _N , see data charts for details
max. inrush current	300 × I _N
dissipation losses	approx.. 0.25 ... 0.40W/kvar
max. relative humidity	95%
max. altitude	4000m a.s.l.
ambient temperature class	- 40/D (max. 55°C, average 24h: 45°C)
statistical life expectancy (permitted failure rate ≤ 3 %)	> 100 000 h
standards	IEC 60831 (2003), VDE 0560-46/47 UL Standard No. 810, CSA C22.2 No. 190-M1985, GOST 1282-88, ISI 13340/13341
approval marks	 

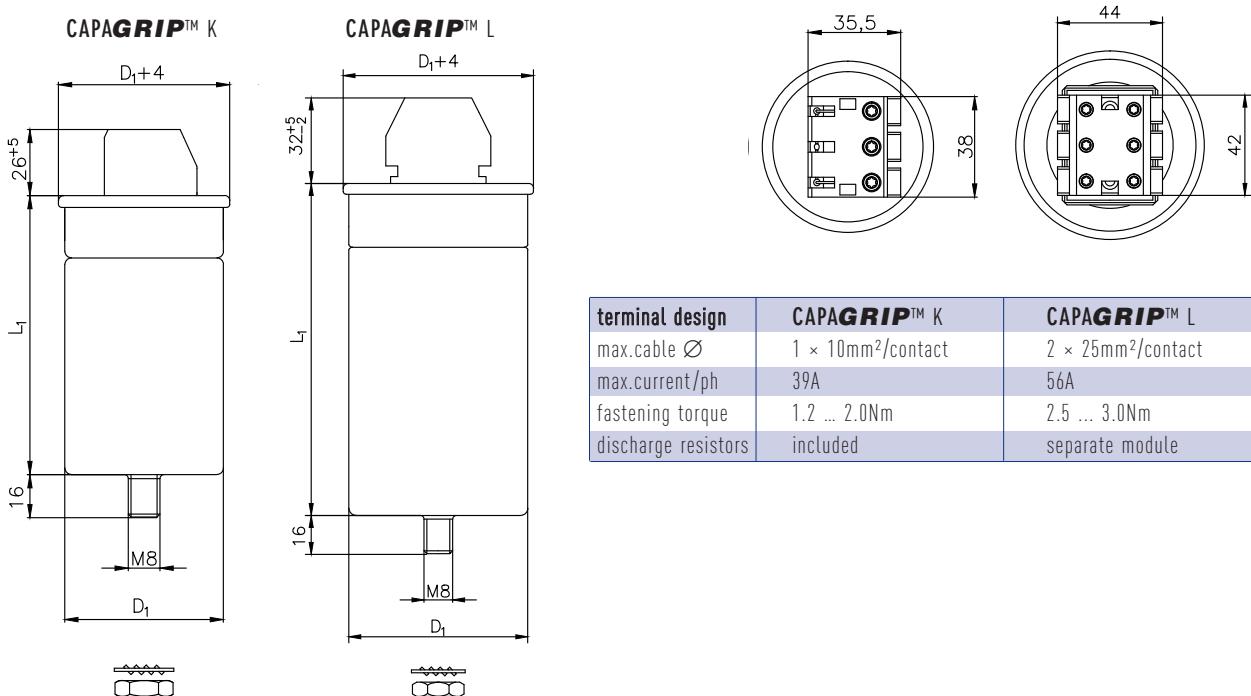

FK-DR™

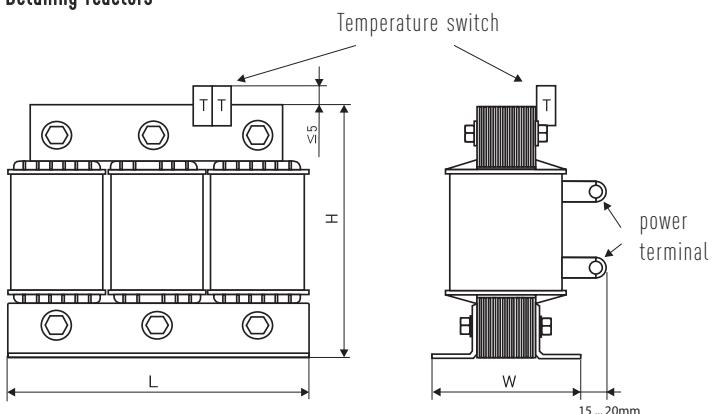

design	three phase, iron core with multiple air gaps, IP00
tolerance of inductance	- 3 ... + 3%
terminals	copper lugs; cables available on request
winding material	aluminium band or copper winding
safety device	thermal switch (125°C ± 5K)
impregnant	polyester resin Class F
current linearity	7%: 1.5 × I _N , higher values on request 5.67%: 1.8 × I _N , higher values on request
permitted harmonic load	U3 = 0.5% U _N U5 = 6.0% U _N U7 = 5.0% U _N U11 = 3.5% U _N U13 = 3.0% U _N
insulation voltage winding to core	3kV
max. relative humidity	95%
temperature class	T40
statistical life expectancy (permitted failure rate ≤ 3%)	> 200 000 h
standards	EN61558-2-20:2000, VDE 0570-2
approval marks	

DIMENSION DRAWINGS

Detuning reactors

Design shown as listed in this catalogue.

Optional terminations:

- screw terminal block
- temperature-proof flexible cables

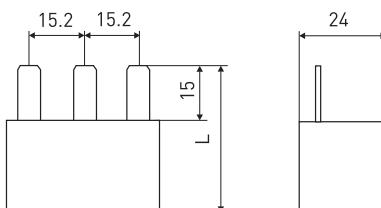

Alternative mounting option:

- threaded bolts for lateral mounting

DISCHARGE DISCHARGE MODULES - THE CONVENIENT MATCH

Capacitors of the **CAPAGRIp™ K** series are fitted with discharge resistors for a discharge < 50V within < 60 seconds. For **CAPAGRIp™ L**, we provide separate resistor modules in a finger-proof housing (IP20) for fast and convenient connection to the terminal.

resistance (kΩ)	U _{max} (V)	L (mm)	order no.
3 × 120	480 V	27	275.100-10120
3 × 180	600 V	27	275.100-10180

HOW TO READ THE SELECTION CHARTS

Capacitors, Reactors, and Contactors

A. You are looking for capacitors and contactors in a non-detuned capacitor bank, e.g. operation at 400V:

- Select required capacitor power on page 6, e.g. 50kvar; as per chart, you need to use two pcs of item 275.169-516600.
- See data of 25kvar 400V for details on the individual capacitors.
- Recommended discharge resistors for each capacitor in the set: Module part no. 275.100-10120.
- Select matching capacitor contactor type 17237.004-50.0.

capacitor power	U_n	C_0 [μF]	I_n [A]	f_m [Hz]	$D = L_1$ [mm]	m [kg]	Design	order no.	order code		recommended discharge	order code

B. You require a matching reactor with detuning factor 5.67% for the above:

- Go to page 10 and look up the matching reactor in the line which corresponds to the (over-lapped) capacitor line of 50kvar 400V. The resulting power output of the LC-circuit will be 53kvar at 400V.
- Mind that due to the higher power output, you must now use a bigger contactor (17237.004-50.7).
- Note that with a capacitor set from the 440V range and matching reactor, you could achieve an exact output of 50kvar into the 400V mains and use the smaller contactor 17237.004-50.0.

① 53 ② ...-50.7 ③ 50 ④ ...-50.0

C. Your specification prescribes the use of capacitors with a higher voltage rating for a detuned application.

Example: 25kvar 400V 50Hz, 7% reactor, capacitors must have 525V rating.

- Select required power of LC-circuit on page 7, (25kvar 400V); use the visible part of overlapped capacitor chart (page 11) on the right-hand margin as indicator for proper capacitor voltage.
- Select matching capacitor contactor type 17237.004-25.0.
- Go to page 11 for details of the applicable capacitor.

You are recommended to use 2 pcs of 20kvar 525V capacitors.

Rated Voltage U_N

Root mean square of the max. permissible value of sinusoidal AC voltage in continuous operation. The rated voltage must not be exceeded even in cases of malfunction. Bear in mind that capacitors in detuned equipment are exposed to a higher voltage than that of the rated mains voltage; this is caused by the connection of detuning reactor and capacitor in series. Consequently, capacitors used with reactors must have a voltage rating higher than that of the regular mains voltage.

Rated Power Q_c

Reactive power resulting from the ratings of capacitance, frequency, and voltage.

Current Rating I_N

RMS value of the current at rated voltage and frequency, excluding harmonic distortion, switching transients, and capacitance tolerance.

Maximum RMS Current Rating I_{max}

Maximum rms value of permissible current in continuous operation. In accordance with EN 60831 all ELECTRONICON capacitors are rated at least 1.3xI_N, allowing for the current rise from permissible voltage and capacitance tolerances as well as harmonic distortion. Continuous currents that exceed these values will lead to a build-up of heat in the capacitor and - as a result - reduced lifetime or premature failure. Permanent excess current may even result in failure of the capacitor's safety mechanisms, i.e. bursting or fire.

LC output @ U_{mains} :

The series combination of detuning reactor (L) and capacitor (C) causes a voltage rise at the capacitor terminals. The capacitor then produces more kvar than under "normal" circumstances. This value states the kvar output delivered by the LC-set into the mains.

I_{eff} :

Permitted current load on the reactor in permanent operation, caused by the fundamental wave plus harmonics in the system. For all data given in this catalogue, we are assuming a 10% increase of the fundamental current, resulting from voltage tolerances as permitted by DIN EN 50160.

LC output @ U_{mains} :

The series combination of detuning reactor (L) and capacitor (C) causes a voltage rise at the capacitor terminals. The capacitor then produces more kvar than under "normal" circumstances. This value states the kvar output delivered by the LC-set into the mains.

I_{eff} :

Permitted current load on the reactor in permanent operation, caused by the fundamental wave plus harmonics in the system. For all data given in this catalogue, we are assuming a 10% increase of the fundamental current, resulting from voltage tolerances as permitted by DIN EN 50160.

MKPc™
480...525V
50Hz

MKPc™ Gas-filled Power Capacitors for non-detuned use in mains of 400V...525V 50Hz or for detuned systems at 400...440V 50Hz

Rated Voltage U_N

Root mean square of the max. permissible value of sinusoidal AC voltage in continuous operation. The rated voltage must not be exceeded even in cases of malfunction. Bear in mind that capacitors in detuned equipment are exposed to a higher voltage than that of the rated mains voltage; this is caused by the connection of detuning reactor and capacitor in series. Consequently, capacitors used with reactors must have a voltage rating higher than that of the regular mains voltage.

Rated Power Q_C

Reactive power resulting from the ratings of capacitance, frequency, and voltage.

Current Rating I_N

RMS value of the current at rated voltage and frequency, excluding harmonic distortion, switching transients, and capacitance tolerance.

Maximum RMS Current Rating I_{max}

Maximum rms value of permissible current in continuous operation. In accordance with EN 60831 all ELECTRONICON capacitors are rated at least 1.3xI_N, allowing for the current rise from permissible voltage and capacitance tolerances as well as harmonic distortion. Continuous currents that exceed these values will lead to a build-up of heat in the capacitor and - as a result - reduced lifetime or premature failure. Permanent excess current may even result in failure of the capacitor's safety mechanisms, i.e. bursting or fire.

CAPACITOR CONTACTORS

General Technical Data

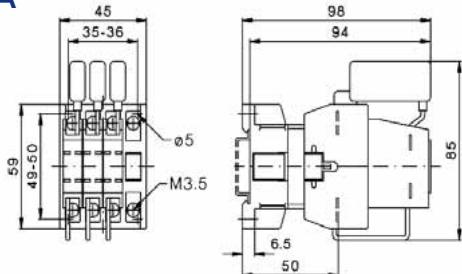

design	magnetic, three phase, with pre-load contacts for inrush protection
voltage range	Umains = 400...440V (other voltages available on request)
control voltage	220...240V (other voltages available on request)
mounting	DIN hat rail W × H = 35 × 7.5mm or base mounting lugs for Ø5mm screws
snap-on auxiliary contacts	available on request
standards	IEC947-4-1, EN60947-4-1, VDE0660

Approval marks	 	

CE Conformity

The controller is declared to conform with the following European Directives:

- | | |
|-------------|---|
| 73/23/EWG | Low-Voltage Directive |
| 2004/108/EG | EMC directive |
| 93/68/EWG | Directive for amendment of directive 73/23/EWG (CE- Mark of Conformity) |

IMPORTANT IMPORTANT REMARKS

12 Months Limited Warranty

All our products are designed, manufactured, and tested with the highest care and workmanship. The satisfaction of our customers is our highest goal. We therefore warrant remedying any defect in the goods resulting from faulty design, materials or workmanship, which appears within 12 months from the date of sale.

This warranty does not cover defects due to improper use of the goods or operation at conditions exceeding the rated values stated in the catalogue or special data sheet. Nor does it cover defects due to faulty maintenance or incorrect installation, alterations or faulty repairs undertaken by the Buyer. Finally the warranty does not cover normal wear and tear or deterioration.

Protection Against Overvoltages and Short Circuits: Self-Healing Dielectric

All dielectric structures used in our power capacitors are "self-healing": In the event of a voltage breakdown the metal layers around the breakdown channel are evaporated by the temperature of the electric arc that forms between the electrodes. They are removed within a few microseconds and pushed apart by the pressure generated in the centre of the breakdown spot. An insulation area is formed which is reliably resistive and voltage proof for all operating requirements of the capacitor. The capacitor remains fully functional during and after the breakdown.

For voltages within the permitted testing and operating limits the capacitors are short-circuit- and overvoltage-proof.

They are also proof against external short circuits as far as the resulting surge discharges do not exceed the specified surge current limits.

Mounting and Cooling

The useful life of a capacitor may be reduced dramatically if exposed to excessive heat. Typically an increase in the ambient temperature of 7°C will halve the expected life of the capacitor. Make sure to obey the permitted operating temperatures of ambient temperature class D (max. temperature 55°C, max. average over 24hrs. 45°C, max. average over 365 days 35°C).

To avoid overheating the capacitors must be allowed to cool unhindered and should be shielded from external heat sources. We recommend forced ventilation for all applications with detuning reactors. Give at least 20mm clearance between the capacitors for natural or forced ventilation, and do not place them directly above or next to heat sources such as detuning or tuning reactors, bus bars, etc.

Functioning of the BAM™ (Break Action Mechanism)

In the event of overvoltage or thermal overload or ageing at the end of the capacitor's useful service life, an increasing number of self-healing breakdowns may cause rising pressure inside the capacitor. To prevent it from bursting, the capacitor is fitted with an obligatory "break action mechanism" (BAM). The BAM™ is based on an attenuated spot at one of the connecting wires inside the capacitor. With rising pressure the case begins to expand, mainly by opening the folded crimp and pushing the lid upwards. As a result, the prepared connecting wire is separated at the attenuated spot, and the current path is interrupted irreversibly.

Warning:

It has to be noted that this safety system can act properly only within the permitted limits of loads and overloads. The simple presence of a safety mechanism does not mean that catastrophic failures are completely impossible. Strong overvoltages, permanent external heat, and heavy current overload, e.g. during harmonic resonances may cause sudden, uncontrollable rise of temperature and pressure inside the can which may not leave sufficient time for the BAM™ to act properly, and result in explosion and fire.

Safety

ELECTRONICON will not indemnify or be responsible for any kind of damages to persons or property due to the improper application of any capacitors or reactors purchased from ELECTRONICON or its distributors. The capacitors and reactors should only be used for the application intended.

Mind that electrical or mechanical misapplication of capacitors and reactors can become hazardous. Misapplied capacitors can explode or catch fire and cause bodily injury or property damage due to the expulsion of material or metal fragments.

Please consult the detailed instructions for mounting and application stated in our Catalogue brochure "Capacitors and Reactors For Power Factor Correction", and on the ELECTRONICON website. If in doubt about how to connect, operate, or discharge a capacitor, consult ELECTRONICON engineering.

For more detailed information, please order our comprehensive catalogue "Capacitors and Reactors for Power Factor Correction", and the "General Safety Advice for Power Capacitors" issued by the German Electrical and Electronic Manufacturer's Association (ZVEI).

See our "General Conditions" for details on Warranty and Product liability.

APPROVED
APPROVED QUALITY AND PERFORMANCE

Regular investments in advanced and environmentally sound technologies guarantee the highest standards in manufacture and quality to standards which are approved worldwide. The **ELECTRONICON** system of quality assurance has been approved by the TUV organisation to ISO 9001, VDE is monitoring our production facilities on a regular base.

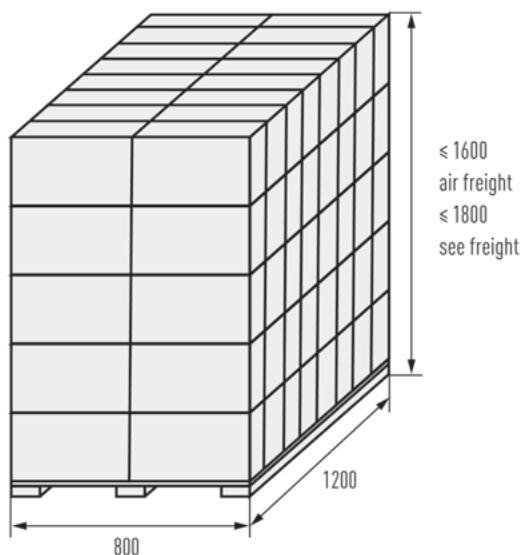

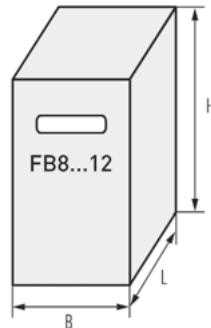

PACKING DETAILS

Capacitors

Type Box	L × B × H mm	Box/pallet
FB 8	393 × 153 × 270	80
FB 9	393 × 153 × 320	70
FB 10	393 × 153 × 370	56
FB 12	393 × 153 × 330	70

Box

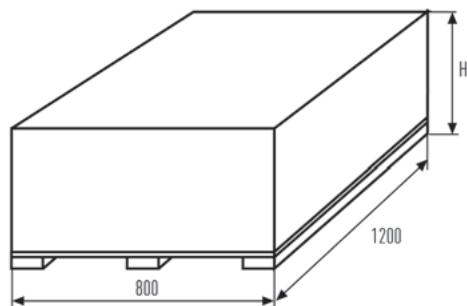

Carton, sealed with adhesive paper tape

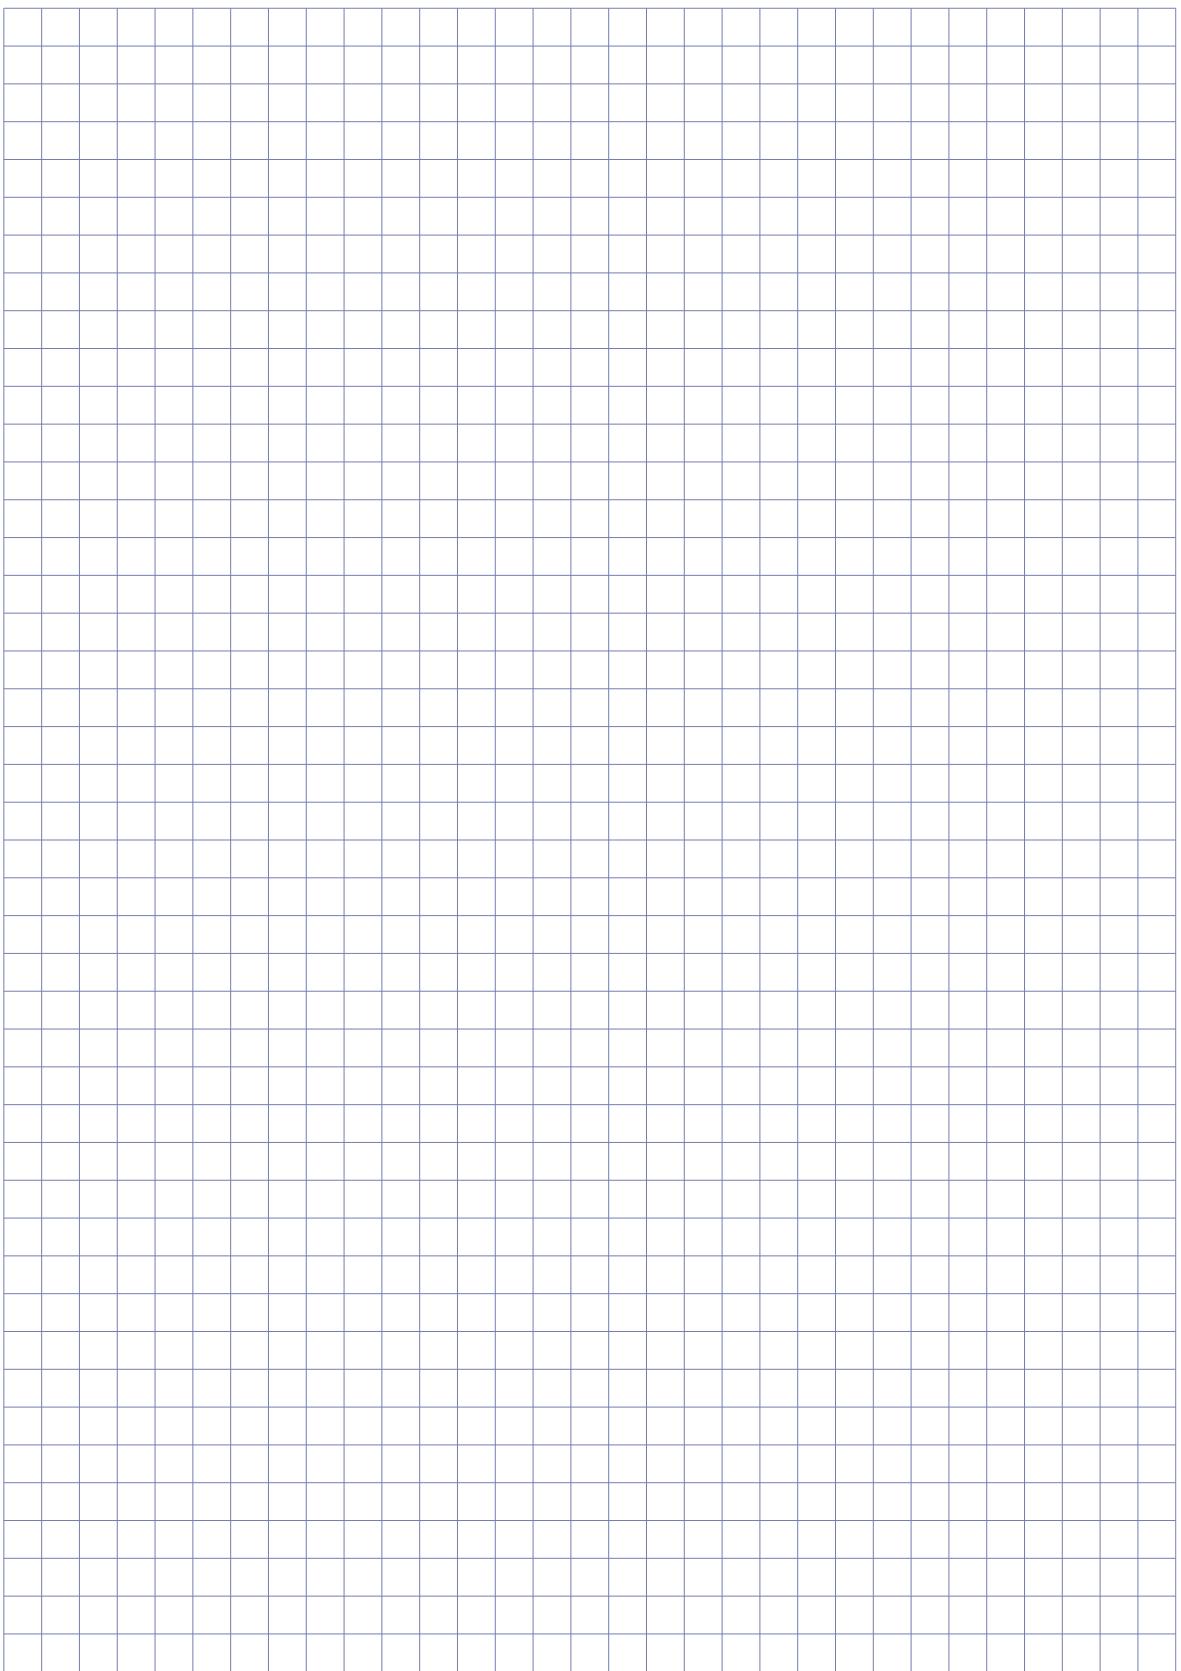

Pallet

Standard Euro-pallet (fumigated if required), wrapped in PP-foil

Reactors

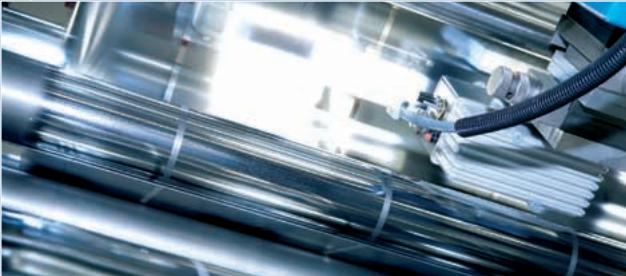

Wooden frame on standard Euro-pallet (fumigated if required)

**EXCELLENT EXPERIENCE IN
CAPACITOR MAKING FOR 75 YEARS**

Gera has been a centre of capacitor making since 1938. ELECTRONICON Kondensatoren GmbH which emerged from previous RFT/VEB ELEKTRONIK Gera in 1992, has become one of Europe's leading capacitor manufacturers supplying customers worldwide and being an open and competent partner for manufacturers and users of power factor correction equipment, for many manufacturers of drives, power electronics, home appliances, and for the lighting industry. Regular investments in advanced and environmentally sound technologies guarantee the highest levels in manufacture and quality to modern standards which are approved and monitored by leading certification authorities.

In today's globalised competition, we distinguish ourselves by

- Absolute reliability and safety of our products
 - Close co-operation between manufacturer and client to meet both technical and commercial requirements
 - Improvement and development of our technical expertise in capacitor design and manufacture, as well as film coating, with special attention paid to the MKPg-technology
 - Early identification and incorporation of new trends and methods in the manufacturing of capacitors
 - Flexibility and punctual fulfilment of our commercial obligations

Our experienced development engineers are competent and responsible for both implementing the latest technical trends applicable to our products and ensuring that our products adapt to the challenges of traditional and new markets.

The close and intense co-operation between the departments of Marketing & Sales, Research & Development, and Production has become the keystone of our success. ELECTRONICON is continually striving to establish a similarly close and interactive relationship with its distributors and direct clients both in home and overseas markets, to become not just one out of many suppliers, but your preferred partner for ideas and solutions.
